Define an ontology to describe cars, in the context of one of the organizations which produce/use/market them!

What you would / should know about car in order to describe them in the most appropriate way for the tasks of your organization.

Provide an (informal) description of the ontology that defines the characteristics of the cars which you consider important

Food for thought**:**

- How can you classify these characteristics?
- Do the data you are defining need some "rule" that specifies how it should be presented and/or described?
- In what format should this data be (for instance, numbers, free text, standardized text, which kind of measurement)?
- Which types of data need standardization, and which do not need it? Why?
